

Problem Statement: Loan Approval Prediction Agent

The Challenge

Loan approval is a critical process in the banking and financial sector, yet evaluating loan applications manually can be time-consuming, inconsistent, and prone to errors. Financial institutions must assess multiple factors such as applicant income, employment status, education, credit history, loan amount, loan term, and repayment capacity before making a decision. Without an intelligent, data-driven system, loan approvals may be delayed, inconsistent, or inaccurate, increasing financial risk for lenders and creating inconvenience for applicants. There is a need for an AI-powered solution that can analyze applicant information efficiently, provide transparent loan eligibility predictions, and assist both applicants and financial institutions in making faster and more informed decisions.
